
Free Download Cpac Imaging Pro 4.0 !!HOT!! Full Version

To investigate the influence of the trifluoromethyl group on the two-phase liquid/liquid extraction of capactively coupled contactors; and develop a full-scale chromatographic system based on the Cpac image pro dbc-1251 data, and most studies focused on the relationships between physicochemical properties, such as emulsion uniformity, stability of the two-phase extraction system; and The present invention relates to a color laser imaging system and, more particularly, to a high resolution color imaging system, utilizing a color laser light, for exposing a recording medium bearing a negative color image of an object. In a conventional imaging system employing a laser light such as a semiconductor laser, for example, a technique is known in which a negative color image of an object is exposed on a photographic paper under the irradiation of a laser light by arranging an aperture plate located upstream of the photographic paper in the direction of a laser light path to be used as an aperture. For example, a conventional technique disclosed in the U.S. Pat. No. 3,793,618 comprises a negative-to-positive color converter comprising a positive sensitive material for red light, a positive sensitive material for green light, and a positive sensitive material for blue light. With the imaging technique as described above, however, the density of each of the images is inevitably changed according to variation in the amount of exposure of the object, and, in addition, if the exposure amount is not so controlled by any measure, the density of an image is changed by variation in the amount of reflection of the light passing through the aperture plate. In order to avoid the above-mentioned problems, a technique is also known in which the irradiation of laser light is commenced after the aperture plate is placed to stop the laser light. For example, a technique disclosed in the U.S. Pat. No. 4,892,391 comprises a photoelectric transducer for converting input light into electric signals, a trigger circuit for causing the conversion, a light attenuating means for attenuating the input light to the photoelectric transducer and for operating in response to the electric signals, and a second light attenuating means for attenuating the input light by a predetermined amount to a photographic sensitive material. In this technique, a lens and a second light attenuating means for attenuating the input light to the lens are inserted between the aperture plate and the photographic sensitive material, and the second light attenuating means
